

# Database Indexes for Fun and Speed

Ian Whitney

whit0694@umn.edu

@ian\_whitney (Slack)

# Imagine An Unsorted Phonebook

Row	Last Name	First Name	Middle Initial
1	Miller	Jessica	E
2	Grant	Anna	C
3	White	Beryl	D
4	Williams	Steven	R
5	Grant	Charlotte	A
6	Whitney	Ian	M
7	White	Arthur	D

## Let's query that Phonebook

```
select * from phone_book where last_name = 'Whitney'
```

# Let's add an index

```
create index phone_book_last_name on phone_book(last_name);
```

Last Name	Row
Grant	2
Grant	5
Miller	1
White	3
White	7
Whitney	6
Williams	4

## But Looking By Last Name Sucks

```
select * from phone_book where last_name = 'Whitney' and first_name = 'Ian';
```

# We could add another index

```
create index phone_book_first_name on phone_book(first_name);
```

First Name	Row
Anna	2
Arthur	7
Beryl	3
Charlotte	5
Ian	6
Jessica	1
Steven	4

**This is probably better**

**But...**

- Your database now has to maintain two indexes
- And none of your users ever query by just first name
  - It's always last name & first name

# Let's add a better index

```
create index phone_book_first_last_name on phone_book(first_name, last_name);
```

Last Name	First Name	Row
Grant	Anna	2
Grant	Charlotte	5
Miller	Jessica	1
White	Arthur	7
White	Beryl	3
Whitney	Ian	6
Williams	Steven	4

## **Which Index Gets Used?**

We now have 3 indexes. Which of them get used?

## Query by lastname, firstname

```
select * from phone_book where last_name = 'Whitney' and first_name = 'Ian';
```

Uses: phone\_book\_first\_last\_name

## Query just by first name

```
select * from phone_book where first_name = 'Ian';
```

Uses: phone\_book\_first\_name

## Query just by last name

```
select * from phone_book where last_name = 'Whitney'
```

Uses: phone\_book\_first\_last\_name

## The Rule

If the column(s) in your where clause are the left-most columns in a multi-column index: 👍

```
create index phone_book_last_first_name on phone_book(last_name, first_name);
```

✅ where last\_name = 'Whitney'

✅ where last\_name = 'Whitney' and first\_name = 'Ian'

❌ where first\_name = 'Ian'

**Delete that last name index!**

**It's redundant**
